

Wastewater Treatment Products

Lafayette, Louisiana Wastewater Treatment Facility

The South Wastewater Treatment Plant in the city of Lafayette, Louisiana is a treatment facility with flows between 7 and 8.5 million gallons a day. Although discharges were within permit levels prior to treatment, the system was overloaded with high energy costs.

The plant had similar sections, termed East and West. The West side of the facility was treated with Micro-Bac Wastewater products , while the East side was left untreated.

During the test period, the West side, seeded with Micro-Bac products , substantially out-performed the control (The East Side).

The second test was run after switching control and test sides. The results were essentially the same, confirming the performance obtained in the previous test.
